

There's comes a time in life when missing teeth aren't cute or convenient. Even just one missing tooth can cause problems eating foods you love, keep you from smiling and affect your self-esteem. Dental implants are an option when you need to replace a single tooth, or if you're missing several teeth. The American College of Prosthodontists reports that "more than 35 million Americans do not have any teeth—and 178 million people in the U.S. are missing at least one tooth." Dr. Branberg can help you love your smile again!

A New Smile In Just One Day

THE DFW DENTAL IMPLANT CENTER ALL-ON-4 TREATMENT CONCEPT

If you're missing teeth, you are not alone.

Tooth loss is extremely common among adults, especially as we age. Recent studies show that more than 35 million people in America are missing all their upper and/or lower teeth. Thanks to advances in dental implant technology, you can have your bright smile back. In many cases, in just one day. That's because you don't need a dental implant for each and every one of your missing teeth. All you need is four precisely placed implants on the top of your mouth, and four on the bottom, to restore your full smile. The All-on-4® treatment concept has been around for nearly two decades. It is a cost-efficient, graftless solution that provides specific patients with a fixed (*non-removable*) full-arch temporary prosthesis on the day of surgery. This improves esthetics, speech, sense of taste and self-esteem in a shorter period of time. And because the implant is made of titanium, it has the unique ability to fuse to living bone and function as part of it. So eventually, the dental implant becomes part of the jawbone and serves as a strong, long-lasting foundation for your new teeth.

BENEFITS

(1) Full-Arch Restoration With Only Four Implants Two straight implants in the front and two tilted implants in the back. By tilting the two back implants, the bone-to-implant contact is increased, providing optimized bone support even when there is a lack of bone. Tilting the back implants also helps to avoid vital anatomical structures and results in a better distribution of the implants for strength.

(2) Immediate Function Treatment time is shorter by providing a fixed (*non-removable*) acrylic temporary bridge on the day of surgery. This eliminates the need for patients to wear a denture while the implants heal.

(3) Graftless Procedure Tilting of the posterior implants avoids the need for time-consuming bone grafting procedures that can prolong treatment.

(4) Lower Costs Less expensive when compared to the traditional option of individual implant crowns and/or bridges.

THE DENTAL IMPLANT CENTER DIFFERENCE At The DFW Dental Implant Center, they understand that when it comes to your dental care—credentials matter. Dr. Steven Branberg is a Prosthodontist with a surgical background in implant dentistry. Prosthodontists spend another three years after dental school specializing in large scale cases, specifically implant dentistry. Dr. Branberg uses his extensive training to ensure a predictable result that he knows his patients will love. When restoring a full arch using four (to six) implants, precise implant placement is essential to the final outcome. If the implants are positioned incorrectly, the esthetics will be affected and the strength of the prosthesis and implants will be compromised. Each patient has a 3D CAT scan to assess the amount available bone and location of vital anatomical structures to help plan treatments. This prosthetic-driven approach assures the best possible outcome. At The DFW Dental Implant Center, you become family as soon as you walk into their office. They offer many services, including permanent dental implants, single tooth implants, bridges and crowns, bone grafting, same day tooth replacement, denture services and more. They also feature sedation dentistry for patients who may feel anxious about having dental work done.

CASE SCENARIO A female patient visited The DFW Dental Implant Center for comprehensive care. She had a history of severe periodontal disease, cavities, missing teeth and was embarrassed by her smile. She did not want anything removable and was interested in dental implants. She also wanted an option that would look natural. She was treated with an All-on-6 treatment in the upper jaw and traditional All-on-4® treatment in the lower jaw. The patient's final prostheses were made of porcelain-fused-to-zirconia for a natural appearance and strength.

BEFORE: (Left) Clinical view of smile before and her Baseline Panoramic x-ray

AFTER: (Right) Clinical view after bridges were attached to implants and Upper and Lower Zirconia Bridges

DENTAL IMPLANT SERVICES

- Single Tooth Replacement
- Implant Bridges (Non-removable)
- All-On-4 (Non-removable)
- Implant Dentures and/or Overdentures (Removable)
- Mini Implants
- Bone Grafting
- Deep Sedation

GENERAL DENTAL SERVICES

- Examinations
- Cleanings
- Tooth-colored Fillings
- Crowns and Bridges
- Removable Partial Dentures
- Complete Dentures
- Full-Mouth Treatments
